AI PRODUCT IDEA BRIEF

JobReady AI — A truthful job-application assistant for early-career Kenyans

1. Problem

Early-career job seekers in Kenya often spend hours comparing job adverts with their CVs and rewriting applications for each role. They may miss important requirements or struggle to describe relevant experience clearly, while generic AI tools can produce claims that are inaccurate or exaggerated.

2. Target users

Kenyan students, recent graduates, and entry-level applicants applying for internships and junior roles in areas such as ICT support, software development, administration, and customer service. The first version is designed for applicants who already have a CV and a specific job advert.

3. What the AI will do

The user provides their CV text and a job description. The AI identifies relevant skills and experience already present in the CV, highlights key requirements from the advert, and suggests up to three tailored CV bullet points using only the user's supplied information. It also flags requirements that are not evidenced in the CV instead of pretending the user has them.

4. Main value

Save time and improve application quality. The product helps users make relevant experience easier for recruiters to notice, while keeping the application accurate and under the applicant's control.

5. MVP — smallest useful feature

A CV-to-job-ad match report: paste a CV and one job advert, then receive (a) the three most relevant existing strengths, (b) up to three suggested CV bullet rewrites grounded in the CV, and (c) a short list of job requirements not clearly demonstrated. The user reviews and edits every suggestion; the product does not submit applications automatically.

6. Risks and guardrails

• Hallucination or fabricated experience: require suggestions to be supported by text in the supplied CV; label unsupported requirements as gaps and ask the user to verify every rewrite.\n• Privacy / personally identifiable information (PII): explain how text is handled, collect only the CV and advert needed for the task, avoid retaining documents by default, and provide a clear delete option. Encourage users to remove ID numbers, home addresses, and other unnecessary sensitive details before pasting.\n• Bias: avoid ranking applicants by protected or irrelevant personal traits; focus feedback on job-related skills and evidence, and let users challenge or ignore recommendations.

7. Success criterion

In a pilot with at least 20 target users, at least 70% should be able to produce a job-specific CV draft in 10 minutes or less, and at least 80% should rate the suggestions as relevant and factually accurate after checking them against their own CV. Track unsupported-claim reports as a safety metric, aiming for zero unflagged fabricated claims in the pilot.
